SFF Committee

SFF-8089 Specification for

SFP (Small Formfactor Pluggable) Rate and Application Codes

Rev 1.3 February 3, 2005

Secretariat: SFF Committee

Abstract: This specification is a companion specification to SFF-8079 SFP Rate and Application Selection. SFF-8079 defines the hardware and software interfaces for controlling and selecting operation among multiple application capabilities within a single SFP module. One aspect of these interfaces is a structure for filling ROM fields in a SFF-8079-compatible SFP module that describes the module's specific capabilities. SFF-8089 defines specific codes for those ROM fields based on industry standards and applications, and it is a dynamic specification that will be periodically be updated to reflect changes in the industry. Other specifications than SFF-8079 may also reference this specification.

This specification provides a common specification for systems manufacturers, system integrators, and suppliers of serial communication modules. This is an internal working specification of the SFF Committee, an industry ad hoc group.

This specification is made available for public review, and written comments are solicited from readers. Comments received by the members will be considered for inclusion in future revisions of this specification.

Support: This specification is supported by the identified member companies of the SFF Committee.

EXPRESSION OF SUPPORT BY MANUFACTURERS

The following member companies of the SFF Committee voted in favor of this industry specification.

ENDL
Infineon
Intel
Nexans
Sun Microsystems
Vitesse Semi

The following SFF member companies voted no on the technical content of this industry specification.

Hewlett Packard

The following member companies of the SFF Committee voted to abstain on this industry specification.

Adaptec
Dell
FCI/Berg
Foxconn Int'l
Fujitsu CPA
Hitachi GST
Madison Cable
Maxtor
Molex
Seagate
Tyco AMP
Unisys

The user's attention is called to the possibility that implementation to this Specification may require use of an invention covered by patent rights. By distribution of this Specification, no position is taken with respect to the validity of this claim or of any patent rights in connection therewith. The patent holder has filed a statement of willingness to grant a license under these rights on reasonable and non-discriminatory terms and conditions to applicants desiring to obtain such a license.

If you are not a member of the SFF Committee, but you are interested in participating, the following principles have been reprinted here for your information.

PRINCIPLES OF THE SFF COMMITTEE

The SFF Committee is an ad hoc group formed to address storage industry needs in a prompt manner. When formed in 1990, the original goals were limited to defining de facto mechanical envelopes within which disk drives can be developed to fit compact computer and other small products.

Adopting a common industry size simplifies the integration of small drives (2 1/2" or less) into such systems. Board-board connectors carrying power and signals, and their position relative to the envelope are critical parameters in a product that has no cables to provide packaging leeway for the integrator.

In November 1992, the SFF Committee objectives were broadened to encompass other areas which needed similar attention, such as pinouts for interface applications, and form factor issues on larger disk drives. SFF is a forum for resolving industry issues that are either not addressed by the standards process or need an immediate solution.

Specifications created by the SFF Committee are expected to be submitted to bodies such as EIA (Electronic Industries Association) or an ASC (Accredited Standards Committee). They may be accepted for separate standards, or incorporated into other standards activities.

The principles of operation for the SFF Committee are not unlike those of an accredited standards committee. There are 3 levels of participation:

- Attending the meetings is open to all, but taking part in discussions is limited to member companies, or those invited by member companies
- The minutes and copies of material which are discussed during meetings are distributed only to those who sign up to receive documentation.
- The individuals who represent member companies of the SFF Committee receive documentation and vote on issues that arise. Votes are not taken during meetings, only guidance on directions. All voting is by letter ballot, which ensures all members an equal opportunity to be heard.

Material presented at SFF Committee meetings becomes public domain. There are no restrictions on the open mailing of material presented at committee meetings. In order to reduce disagreements and misunderstandings, copies must be provided for all agenda items that are discussed. Copies of the material presented, or revisions if completed in time, are included in the documentation mailings.

The sites for SFF Committee meetings rotate based on which member companies volunteer to host the meetings. Meetings have typically been held during the ASC T10 weeks.

The funds received from the annual membership fees are placed in escrow, and are used to reimburse ENDL for the services to manage the SFF Committee.

If you are not receiving the documentation of SFF Committee activities or are interested in becoming a member, the following signup information is reprinted here for your information.

Membership includes voting privileges on SFF Specs under development.

CD_Access Electronic documentation contains:

- Minutes for the year-to-date plus all of last year
- Email traffic for the year-to-date plus all of last year
- The current revision of all the SFF Specifications, as well as any previous revisions distributed during the current year.

Meeting documentation contains:

- Minutes for the current meeting cycle.
- Copies of Specifications revised during the current meeting cycle.

Each electronic mailing obsoletes the previous mailing of that year e.g. July replaces May. To build a complete set of archives of all SFF documentation, retain the last SFF CD_Access mailing of each year.

Foreword

When 2 1/2" diameter disk drives were introduced, there was no commonality on external dimensions e.g. physical size, mounting locations, connector type, connector location, between vendors.

The first use of these disk drives was in specific applications such as laptop portable computers in which space was at a premium and time to market with the latest machine was an important factor. System integrators worked individually with vendors to develop the packaging. The result was wide diversity, and with space being such a major consideration in packaging, it was not possible to replace one vendor's drive with a competitive product.

The desire to reduce disk drive sizes to even smaller dimensions such as 1.8" and 1.3" made it likely that devices would become even more constrained in dimensions because of a possibility that such small devices could be inserted into a socket, not unlike the method of retaining semiconductor devices.

The problems faced by integrators, device suppliers, and component suppliers led to the formation of an industry ad hoc group to address the marketing and engineering considerations of the emerging new technology in disk drives. After two informal gatherings on the subject in the summer of 1990, the SFF Committee held its first meeting in August.

During the development of the form factor definitions, other activities were suggested because participants in the SFF Committee faced problems other than the physical form factors of disk drives. In November 1992, the members approved an expansion in charter to address any issues of general interest and concern to the storage industry. The SFF Committee became a forum for resolving industry issues that are either not addressed by the standards process or need an immediate solution.

At the same time, the principle was adopted of restricting the scope of an SFF project to a narrow area, so that the majority of specifications would be small and the projects could be completed in a rapid timeframe. If proposals are made by a number of contributors, the participating members select the best concepts and uses them to develop specifications which address specific issues in emerging storage markets.

Those companies which have agreed to support a specification are identified in the first pages of each SFF Specification. Industry consensus is not an essential requirement to publish an SFF Specification because it is recognized that in an emerging product area, there is room for more than one approach. By making the documentation on competing proposals available, an integrator can examine the alternatives available and select the product that is felt to be most suitable.

Suggestions for improvement of this specification will be welcome. They should be sent to the SFF Committee, 14426 Black Walnut Ct, Saratoga, CA 95070.

The development work on this specification was done by the SFF Committee, an industry group. The membership of the committee since its formation in 1990 has included a mix of companies which are leaders across the industry.

SFF Committee -

SFP (Small Formfactor Pluggable) Rate and Application Codes

1.0 Scope

This specification does not stand on its own, but is a companion specification to SFF-8079 SFP Rate and Application Selection. SFF-8089 sets the codes for the firmware tables defined within SFF-8079. Other documents than SFF-8079 may also reference this specification.

2.0 References

The SFF Committee activities support the requirements of the storage industry, and it is involved with several standards.

2.1 Industry Documents

The following interface standards may be relevant to this specification.

- INCITS 230-1994	FC-PH	Fibre Channel Physical Interface
- INCITS 297-1997	FC-PH-2	Fibre Channel Physical Interface
- INCITS 352-2002	FC-PI	Fibre Channel Physical Interface
- INCITS 339-2000		Very Long Length Single Mode Optical Variant (SM-LL-V)
- INCITS 364-200x		Fibre Channel -10 Gigabit (10GFC)
- INCITS Project 1506-D		Fibre Channel Physical Interfaces - 2 (FC-PI-2)
- INCITS Project 1625-D		Fibre Channel Physical Interfaces - 3 (FC-PI-3)
- IEEE-802.3 Edition 2002		Ethernet Specification
- Telcordia GR-253-CORE		Synchronous Optical Network (SONET) Transport Systems
- ITU-T G.691		Transmission Systems/Media, Digital Systems/Networks

- SFF-8079	SFP Rate and Application Selection

2.3 SFF Specifications

There are several projects active within the SFF Committee. At the date of printing specification numbers had been assigned to the following projects. The status of Specifications is dependent on committee activities.

F = Forwarded	The specification has been approved by the members for forwarding to a formal standards body.
P = Published	The specification has been balloted by members and is available as a published SFF Specification.
A = Approved	The specification has been approved by ballot of the members and is in preparation as an SFF Specification.
C = Canceled	The project was canceled, and no Specification was Published.
D = Development	The specification is under development at SFF.
E = Expired	The specification has been published, and the members voted against re-publishing when it came up for review.
a = archive	Used as a suffix to indicate an SFF Specification which has been Archived. This specification will always be available at the ftp site and new development effort in the subject area shall be done under a new number.
e = electronic	Used as a suffix to indicate an SFF Specification which has Expired but is still available in electronic form from SFF e.g. a specification has been incorporated into a draft or published standard which is only

available in hard copy.

i = Information The specification has no SFF project activity in progress, but it defines features in developing industry standards. The specification was provided by a company, editor of an accredited standard in development, or an individual. It is provided for broad review (comments to the author are encouraged). As the copyright on such documents is retained by the author, the INF or 'i' specifications cannot be freely copied for distribution.

s = submitted The document is a proposal to the members for consideration to become an SFF Specification.

3.0 General Description

Based on the trend in the market to consolidate SFP transceivers in order to achieve multi-rate and multi-application capable products, an upgraded feature set for the existing Rate select, as described in INF-8074 and SFF-8472, has been developed and specified in SFF-8079.

In order to support a wide variety of applications, two-pin hardware and two-byte serial software interfaces have been defined in SFF-8079. SFF-8079 also defines how the specific applications that a single SFP transceiver supports are listed in the module's ROM, and how the list is read and how a specific application is selected by the host.

SFF-8079 defines the ROM memory space to be within A0h byte 128 to 255. Two bytes for each supported application represent a category and a sub-category. This helps organization and provides sufficient room for up to 63 variants to allow a wide range of potential solutions. Further details can be found in SFF-8079.

SFF-8089 attempts to provide a complete "shopping list" of possible applications based on industry standards. Module vendors can select a sub-list of applications they want to support and program the associated codes into the A0h memory space. In addition to industry standard applications, space is set aside for proprietary or custom applications (details would be provided within the module vendor's data sheets).

This specification is expected to be updated frequently to track and reflect the dynamic market and new or upcoming solutions.

4.0 SFP Rate and Application Codes

4.1 Introduction

Within this clause, the application codes are listed for use according to SFF-8079.

Table 4-1 is the complete "shopping list" of information needed to create the vendor-specific list of supported applications in module memory. The table shows the associated hex codes (Byte 1 and Byte 2) assigned for each application (see SFF-8079 for an explanation for usage of Byte 1 and Byte 2). The Description columns are informative and further describe the listed applications.

The table incorporates room for each category and sub-category in order to allow implementation of future options.

4.2 Application Code Table (ACT)

Table 4-1 Application Code Table

Byte 1# (hex)	Byte 2# (hex)	Category	Variant		Description	
			Standard	Bit Rate [Mb/s]	Variant	According to

4.3 Copper SFP implementation overview

This section defines non-standardized extensions to SFF-8079 to enable application-dependent customization of a host's SerDes or Retimer outputs to drive a passive SFP with an attached copper cable. The host system will read the SFP registers and set an optimum pre-emphasis level, based on pre-determined loss properties of the cable, to drive the assembly without the need of additional equalization. The default setting for host pre-emphasis level is "off", appropriate to drive an optical module.

Table 4-1 Byte 1# value 6h stores a code that specifies the copper SFP assembly's loss data at $\frac{1}{2}$ the baudrate of its highest designed baudrate of operation. A cable assembly designed for 4.25 Gbd shall also store loss data for 1.0625 Gbd and 2.125 Gbd, as this will improve the resolution for pre-emphasis and support operation at multiple data rates. A new cable assembly designed for 2.125 Gbd shall also store loss data for 1.0625 Gbd. A cable assembly designed for lower baudrates does not need to store loss data for higher baudrates. A cable assembly designed for 2.125 Gbd or 4.25 Gbd shall have a maximum frequency response deviation at the specified frequencies of +/-0.5 dB.
